

CO1

Assessment tool - 1

Name: R. Sweta
Reg no: 192511408
Course code: CSA

Short Answers:

- 1) Different ~~sent~~ deployment models of Cloud Computing
- * Public
 - * Private
 - * Hybrid
 - * Community cloud.

Public Cloud

The different deployment models of cloud computing shows how cloud services are used:

Public Cloud:

- ↳ Public Cloud is open to everyone
- ↳ It is open for all who use the internet

Private Cloud:

- ↳ Private Cloud can be used (accessed) only by one organization (authorized)
- ↳ It provides better security.

Hybrid:

- ↳ Hybrid Cloud contain both the public and private cloud.
- ↳ It is public by only authorized organisation get access to private cloud.

Community Cloud:

↳ It is shared by organization and authorized organization where the cloud is only shared.

Examples:

- (i) These Google cloud, Microsoft, Azure, AWS
- (ii) authorized organizations
- (iii) Hospital (Community Cloud), Bank

2) Architecture of Cloud Computing

- * The Cloud Architecture has two main parts. front end and back end.
- * The front end is what ~~are~~ users use.
- * The back end is managed by the cloud provider.
- * The front end request to the cloud
- * It contain servers, storage and network
- * Includes devices, mobile apps.
- * Back end stores data

3) ~~Advantages of Cloud Computing~~ WEB SERVICES

- * web services help different application and communicate online.
- * They make cloud services more and easy to access for use
- * These services work together to complete transactions.
- * they allow data to be shared between system.
- * API make cloud compatibility more efficient and also SOA
- * SOA reduce development time.

4) Advantages and limitations of cloud computing for businesses and educational institutions.

ADVANTAGES
Cloud computing reduce the use of buying hardware.

- * It allows user to access data from anywhere
- * It can be accessed from anywhere
- * It supports user to access at any time
- * The user can access the data stored at any time and from anywhere.

* Disadvantage
Data can be backed up safely in the cloud,
but internet connection is required.

* security and privacy can be concerned

5) Resource Pooling

* Resource Pooling means cloud resources are shared among many users.

* The provider manages these resources efficiently.

* user can create resources

* user can remove resources

* This save both time and effort

* It is only used when needed

* These features improve resource utilization and scalability.
